
CLOSED-DOMAIN RAG • BOOK-ONLY KNOWLEDGE SOURCE

Game of Thrones Book Q&A Chatbot

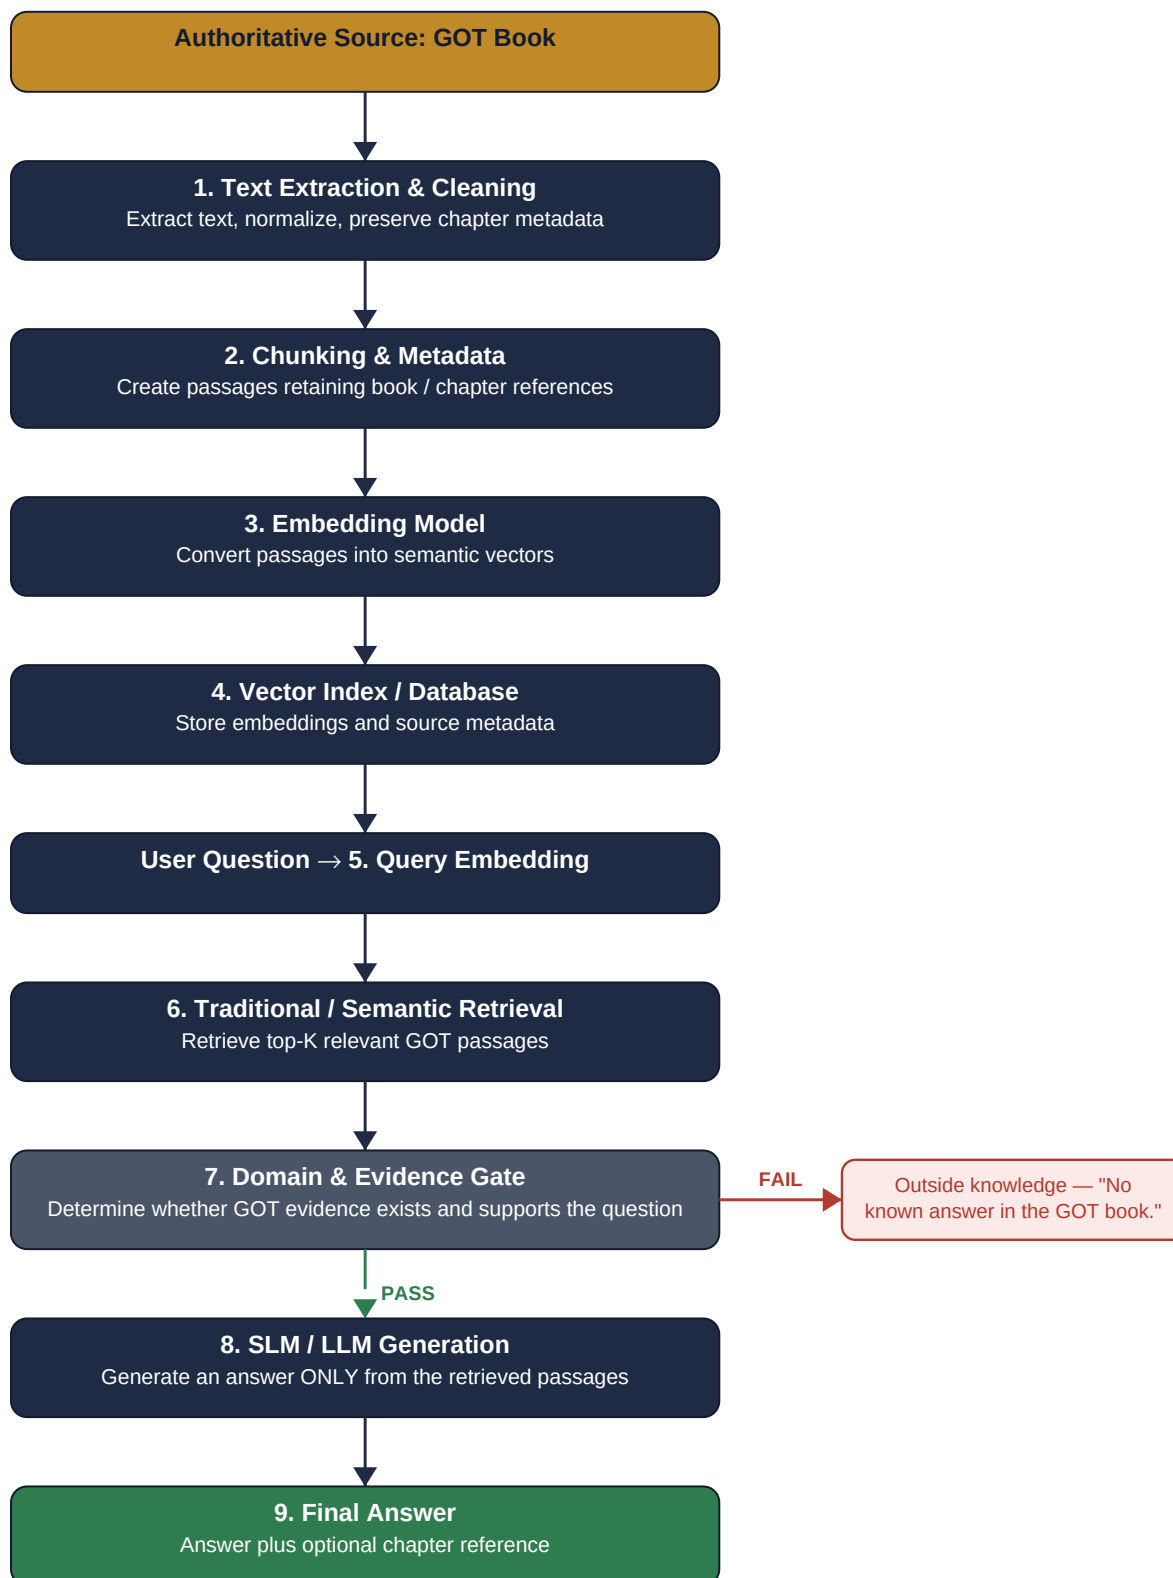

Embedding + Traditional Retrieval + SLM / LLM

1. Objective

Build a question-answering chatbot that uses the **Game of Thrones (GOT) book content as its only knowledge source**. Users can ask about characters, events, relationships, plots, actions, and any other information contained in the book. When a question falls outside that knowledge base, the system must refuse or return an explicit “unknown” response rather than answering from general knowledge.

2. Final Architecture Pipeline

The pipeline combines embedding-based retrieval with a generation stage that is only permitted to answer once supporting evidence has been located in the book.

3. Knowledge Boundary & Strict Flow

The GOT book is the **only source of truth**. The pretrained SLM/LLM is not permitted to supply factual knowledge from its general training — its role is limited to understanding the question and generating a natural-language answer strictly from retrieved GOT evidence.

Core design principle: **retrieve first** → **validate evidence** → **generate second**.

4. Expected Behaviour Examples

Question	Expected Result
Who killed [a character]?	Answer if the event is supported by retrieved GOT passages.
Who married Robb Stark?	Generate an answer from book evidence, after checking the evidence gate first.
Who is Harry Potter?	Refuse — "No known answer in the GOT book."
What happened in a book not included?	Refuse — the question falls outside the knowledge boundary.

Every row above is governed by the same rule: the Domain & Evidence Gate must pass before the generation stage is ever invoked, guaranteeing that answers are always traceable back to the source text.
